Departamento de Doenças Transmissíveis
Coordenação-Geral de Vigilância de Arboviroses

NOTA INFORMATIVA Nº 37/2023-CGARB/DEDT/SVSA/MS

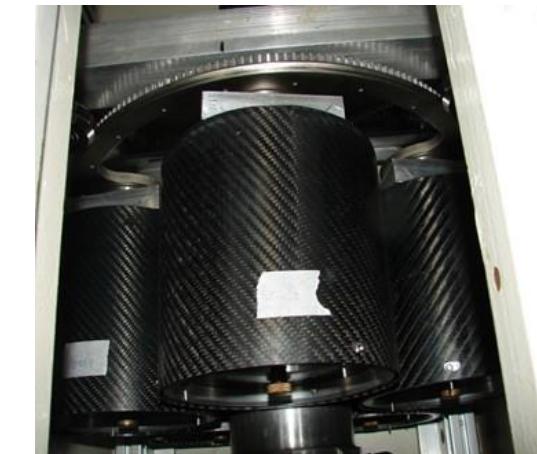

1. **ASSUNTO**
1. Apresenta orientações para implementação de novas tecnologias de controle vetorial em municípios acima de 100 mil habitantes.
4. **TECNOLOGIAS RECOMENDADAS**
4.1. Dentre as tecnologias recomendadas estão a implementação do monitoramento entomológico por ovitrampas², borrifação residual intradomiciliar (BRI-Aedes) em imóveis especiais³, utilização de estações disseminadoras de larvicidas (EDL)⁴, uso de mosquitos com *Wolbachia*⁵, e **utilização de mosquitos estéreis por irradiação (TIE-irradiados) para controle do Aedes aegypti**⁶. Estas

Irradiation with Gammacell 220 (Co₆₀)

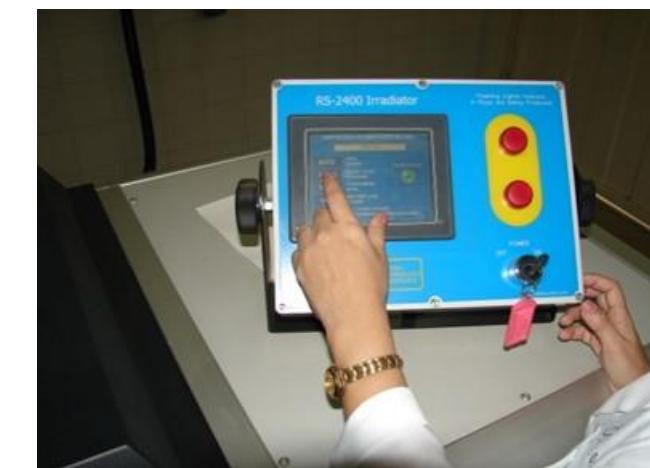

DEN/UFPE

X Ray Machine RS-2400

✓ positioned horizontally inside the X Ray Machine chamber

✓ Control panel (define irradiation conditions)

X-Ray or Gamma Ray?

- ✓ There is no difference in the results obtained in the insect sterilization process

- ✓ Gamma Ray irradiators are expensive, more stable, requires less maintenance, but licensing for operation is more complicated and time-consuming

- ✓ X-Ray irradiators are cheaper, easier licensing but require more maintenance and suffer from overheating.

Sterilizing Insects with Ionizing Radiation

Summary

Exposure to ionizing radiation is currently the method of choice for rendering insects reproductively sterile for area-wide integrated pest management (AW-IPM) programmes that integrate the sterile insect technique (SIT). Gamma radiation from isotopic sources (cobalt-60 or caesium-137) is most often used, but high-energy electrons and X-rays are other practical options. Insect irradiation is safe and reliable when established safety and quality-assurance

A New Generation of X Ray Irradiators for Insect Sterilization

Abstract

Recent fears of terrorism have provoked an increase in delays and denials of transboundary shipments of radioisotopes. This represents a serious constraint to sterile insect technique (SIT) programs around the world as they rely on the use of ionizing radiation from radioisotopes for insect sterilization. To validate a novel X ray irradiator, a series of studies on *Ceratitis capitata* (Wiedemann) and *Anastrepha fraterculus* (Wiedemann) (Diptera: Tephritidae) were carried out, comparing the relative biological effectiveness (RBE)

Rearing mosquitoes

About mass rearing of Ae. aegypti

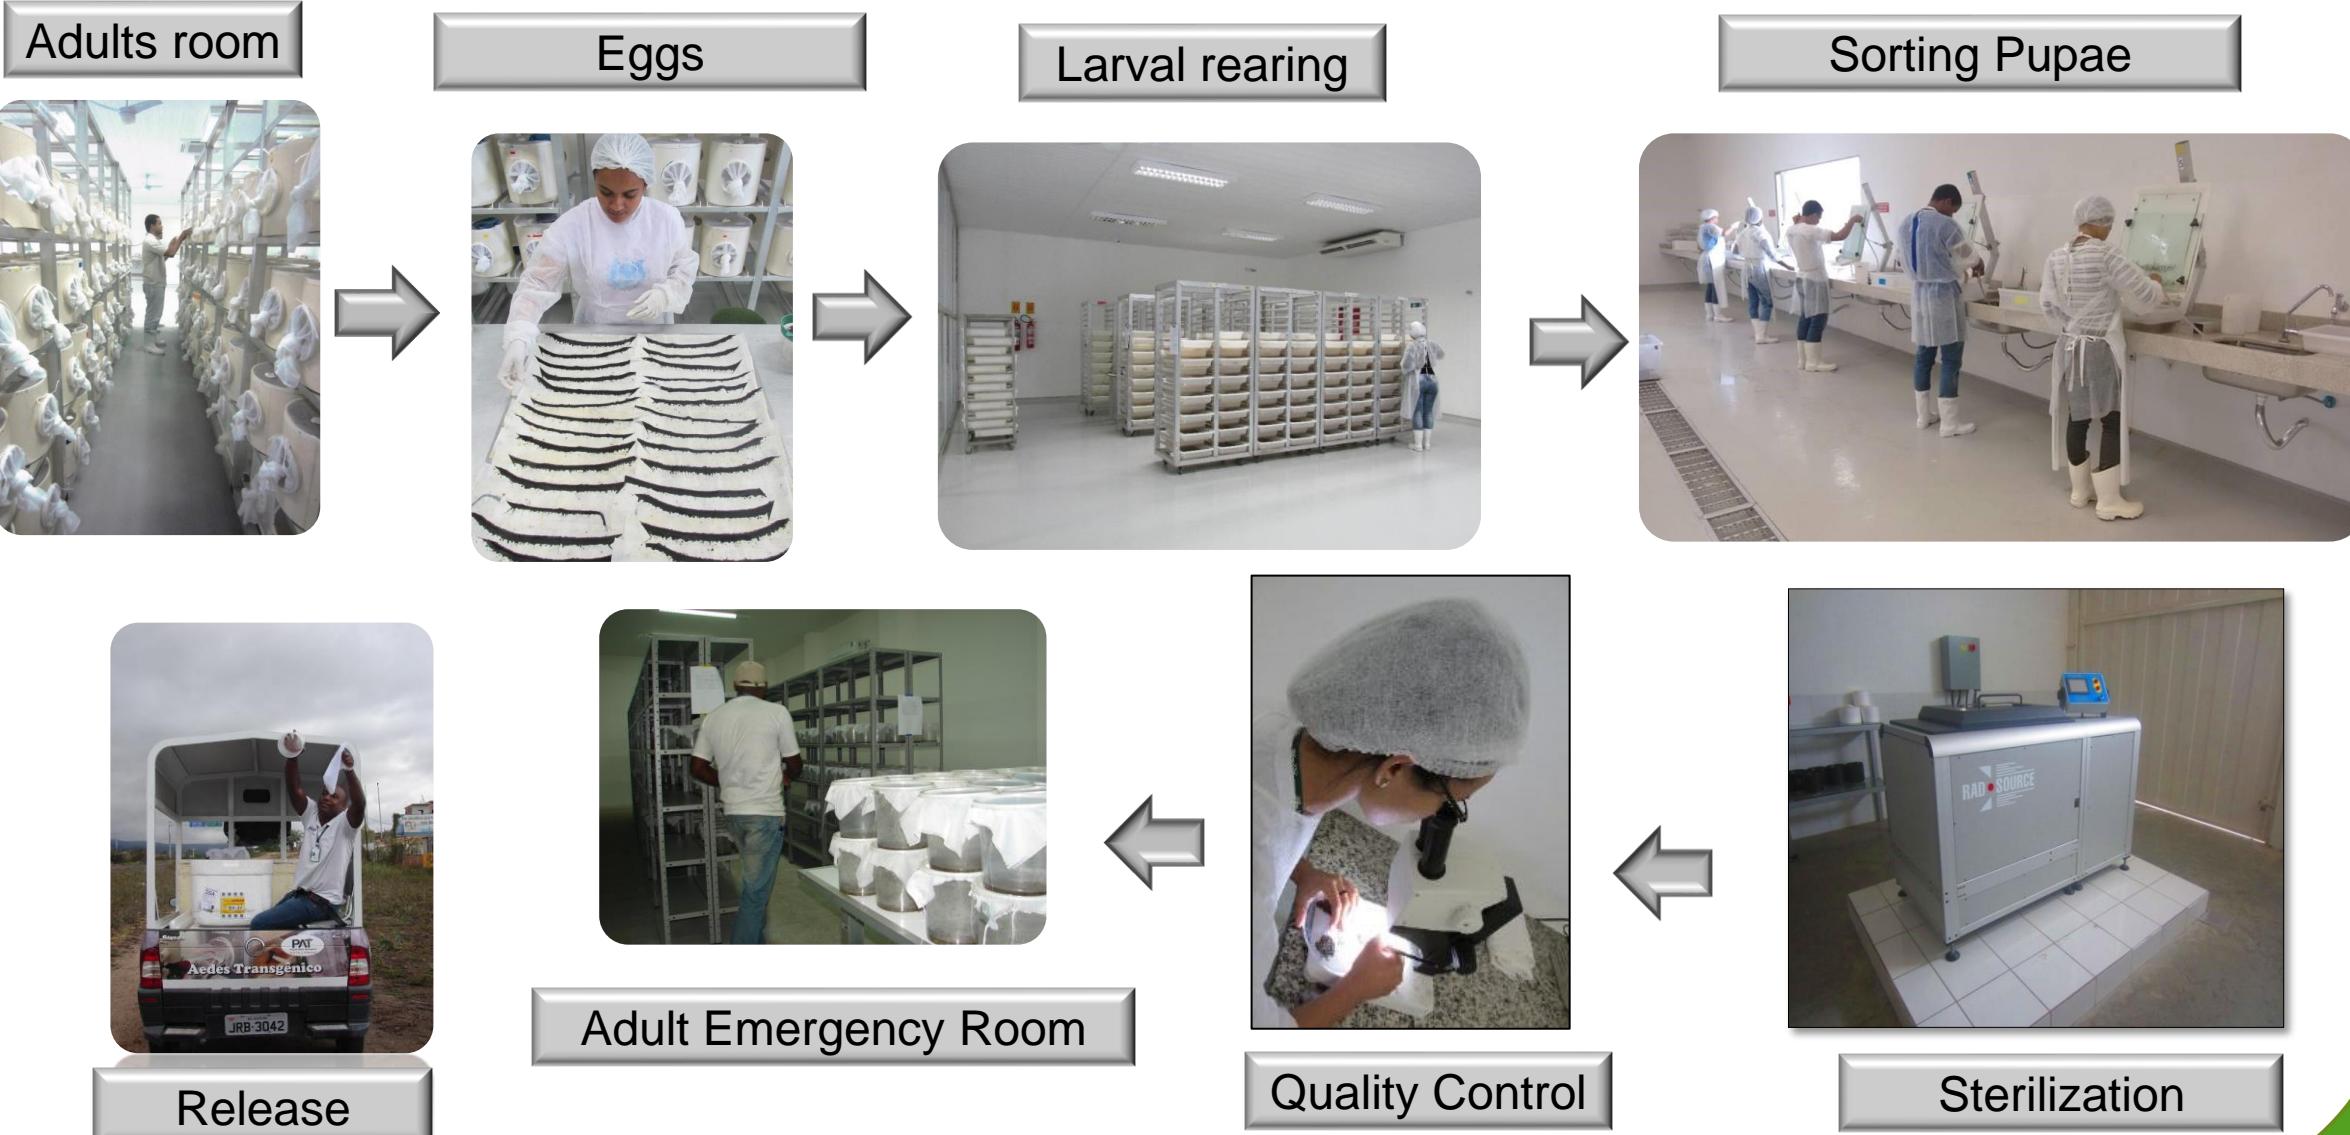

Mass-rearing Unit
4 million sterile males/week

- ✓ Strains: MBR-002
- ✓ Local genetic background;
- ✓ Origin: eggs collected in Recife, Pernambuco

Protocols for mass-rearing of Ae. aegypti

✓ Mass rearing protocols described by Carvalho et al., (2014), some adaptations

In a mass rearing

Requires trained manpower, and turnover is high

Separation of pupae is labor intensive

Production is continuous 24/7.

There are no weekends or holidays.

Expensive diet. Look for alternatives to reduce larval diet costs, looking for local ingredients, or mixing with local and imported ingredients

Adults irradiation

- ▶ Logistics of pupae sorting more efficient and convenient (1 sorting / day).
- ▶ Reduces the loss of material (pupae). We can make better use of the batch in term of sterile males produced;
- ▶ Adults can be immobilized, confine more insects in a smaller space, reduce dose variation and mechanical damage;

Packaging and transport

01

Transport logistics
must prioritize the
shortest travel time

02

Cold chain is crucial
for this phase

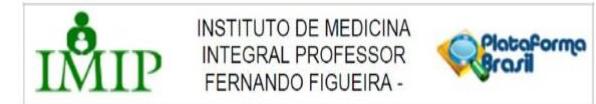

03

Develop devices
that facilitate the
packing and
transport of
mosquitoes. Density
is a key factor.

Authorizations and agreements with those involved

- ✓ Project approved by Ethics Committee (monitoring activities, release of sterile insects, MRR tests).
- ✓ Technical cooperation agreement between Recife City and Moscamed

TERMO DE COOPERAÇÃO TÉCNICA

TERMO DE COOPERAÇÃO TÉCNICA CELEBRADO ENTRE A SECRETARIA DE SAÚDE DO RECIFE E A BIOFÁBRICA MOSCAMED BRASIL.

O MUNICÍPIO DO RECIFE, através da SECRETARIA MUNICIPAL DE SAÚDE, representado neste ato pelo Secretário Municipal de Saúde o Dr. JAISON DE BARROS CORREIA, inscrito no CPF/MF sob o nº 631.466.494-20, RG. nº 589.491-7 SSP/PE, residente e domiciliado na cidade do Recife/PE, nomeado pela Portaria nº 10, publicada no DOM, de 01/01/2013, e a BIOFÁBRICA MOSCAMED BRASIL, com sede na Avenida C 1, Lote 15, Quadra D 13, Distrito Industrial do São Francisco na cidade de Juazeiro, no estado da Bahia, inscrita no CNPJ sob nº 05.378.378/0001-47, neste ato representado pelo Dr. JAIR FERNANDES VIRGINIO, RG. nº. 759.604 SSP/PB e CPF nº 374.337.414-53 resolvem celebrar o presente instrumento, nos termos da legislação pertinente em vigor e de acordo com os termos e condições a seguir pactuados.

Mark-Release-Recapture trial (MRR)

✓ Carried out to define of local strain behavior

- ✓ Ground release
- ✓ Treated area (Brasilia Teimosa)
- ✓ Two releases per week
- ✓ Single point
- ✓ Males marked with different colors

Results:

- Average dispersal of the sterile males:
Approximately 100 meter;
- Sterile males survived for 4 days after release under urban conditions;
- Sterile males introduced approximately 30% sterility in the wild population;

Sterile male releases

✓ TARGET AREA: Brasilia Teimosa, Recife

→ Releases: Oct 2020 to Apr 2022

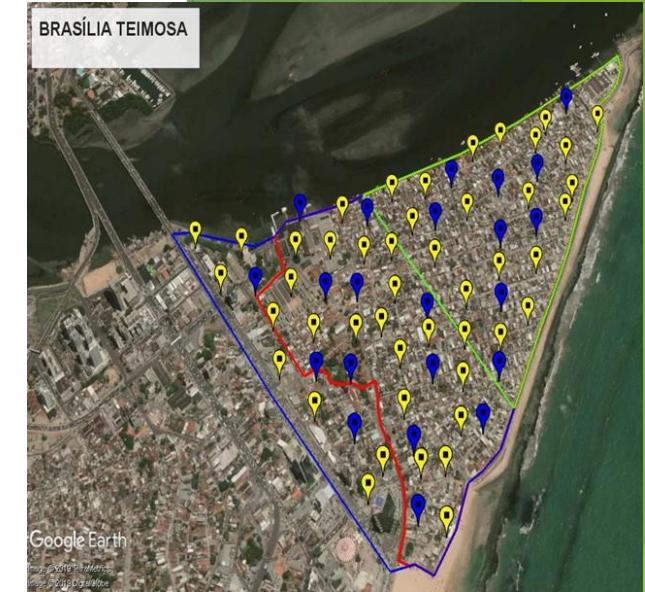

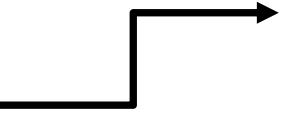

✓ Ground release

→ Plastic pot with a 1,000 sterile males

✓ Once a week, 250 - 300 thousand/week

✓ Twice a week, 0.5 - 1 million/week

✓ 5,000 – 9,000 mosquitos/ha

Area description

Area selection for intervention and no-intervention

- ✓ **CONTROL AREA:** Pina - 58ha; ~ 22.100 inhabitants
- ✓ **TARGET AREA:** Brasilia Teimosa 60 ha; ~ 18.300 inhabitants
- ✓ **Distance from production:** 720 km

Monitoring network

- ✓ **Logistics:** Collection once a week; (contínuous surveillance)

Trapping systems

- ✓ **Trap type:** Ovitrap (eggs collection); BG trap (adults collection)

✓ Mosquito surveillance network based on ovitraps and BG traps

ENTOMOLOGICAL INDICATORS

- ✓ Average number of eggs/trap
- ✓ Index of positive traps
- ✓ Eggs hatching

- ✓ Wild population density
- ✓ Sex ratio
- ✓ Species of Aedes

Releases

Vector control AW-IVM
Population suppression of mosquitoes before start with SIT:
Dissemination Station (PPF)
Mass Egg Capture (Ex. BTi or Spinosad)
Continuous data analysis for course correction in field
Bufer zone
Release once or twice a week

Ground Release Steriles Males

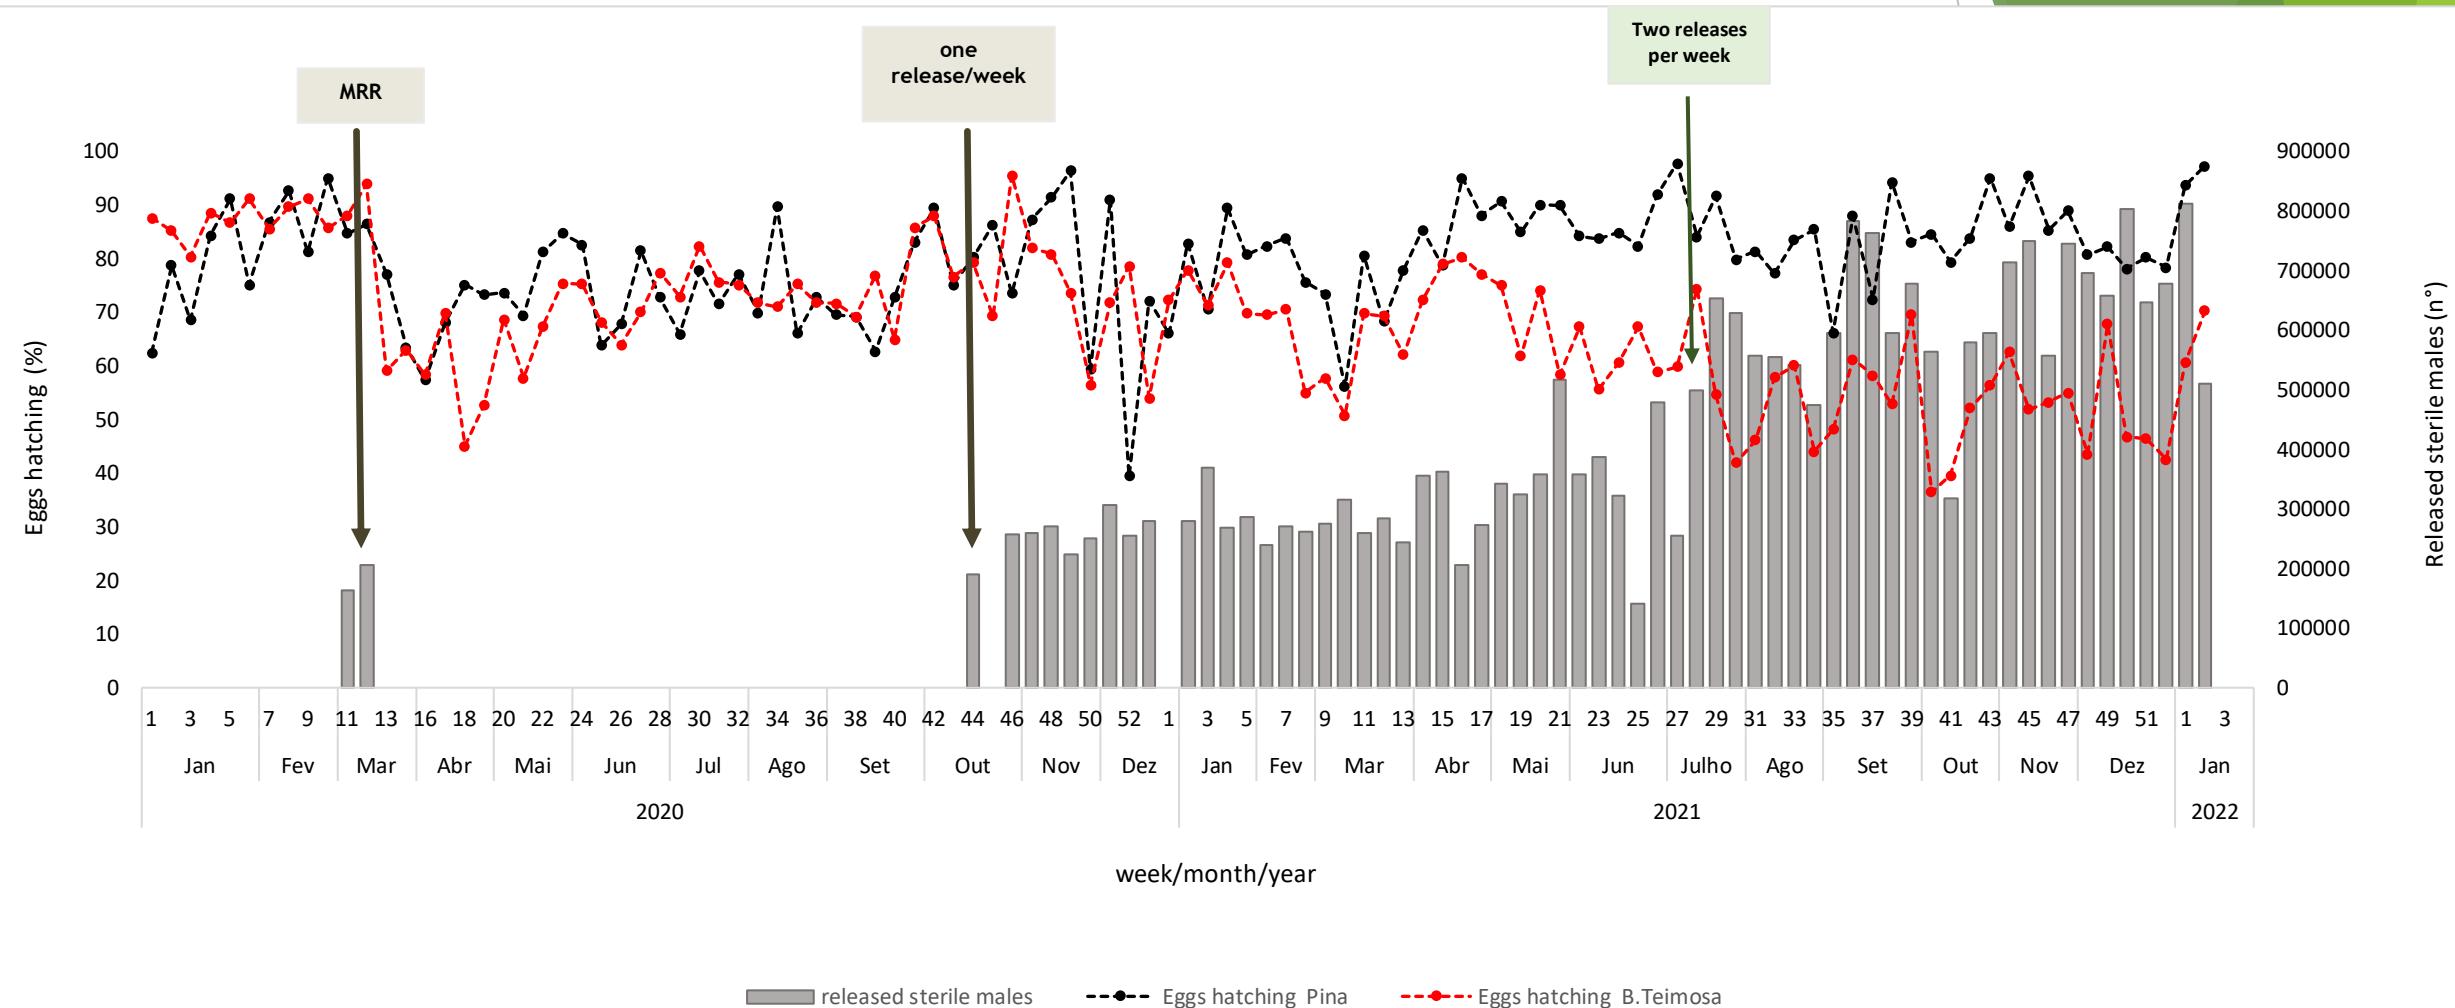

- ▶ Ground release
 - ▶ 1 plastic pot with a 1,000 sterile males
- ▶ Twice a week, 0.5 - 0.7 million/week
- ▶ 5,000 - 9,000 mosquitos/ha

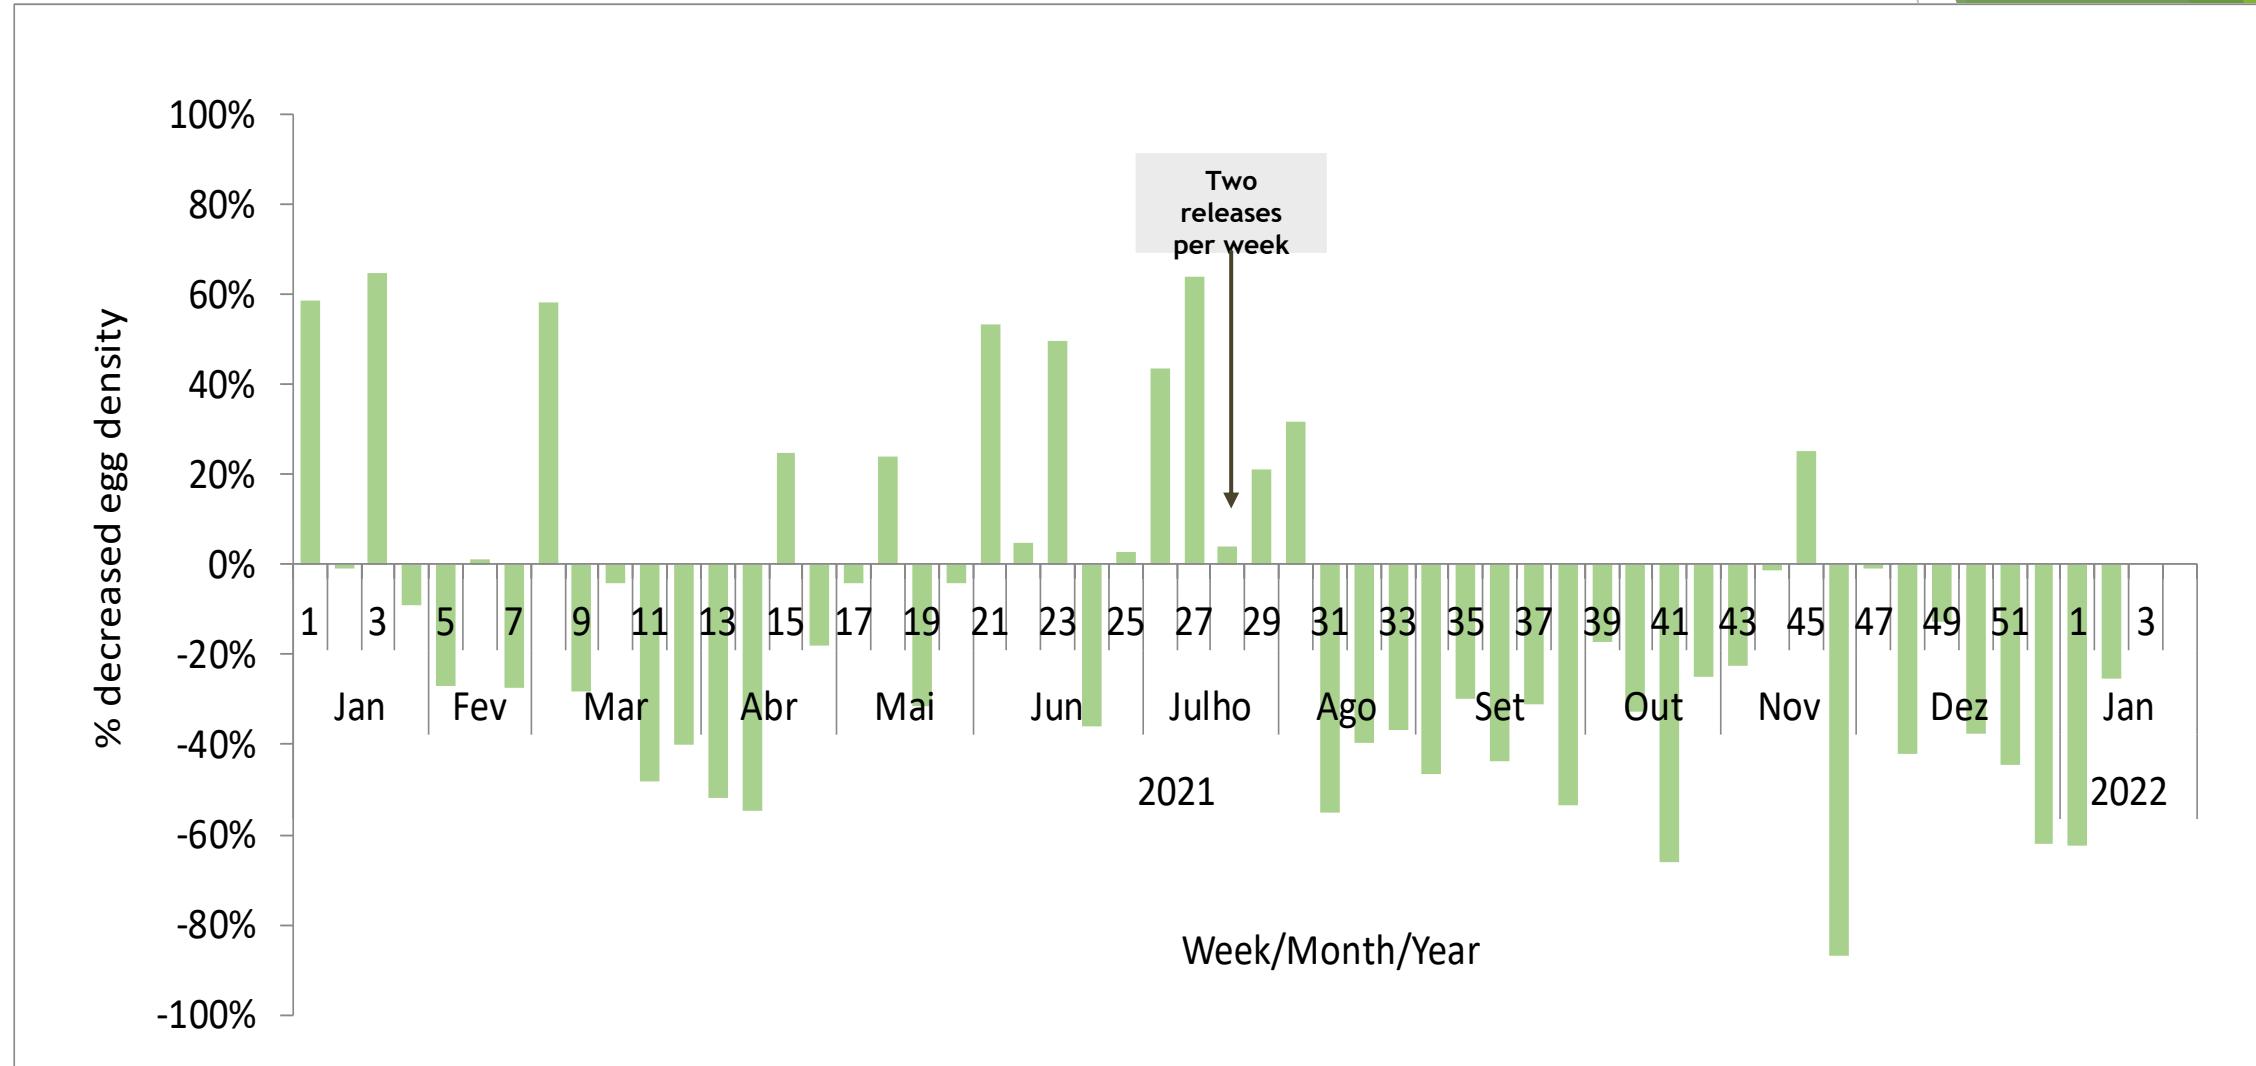

Surveillance

- >> Ovitraps give better answer to figure it out what is going on in the field.
- >> Doubt if the BG's were on all the time
- >> It was very common to relocate traps for better development of activities
- >> Continuous data analysis to learn what is going on. It is essential to have a database installed to facilitate assessments during the project.
- >> Production of maps helps a lot for the data analysis.

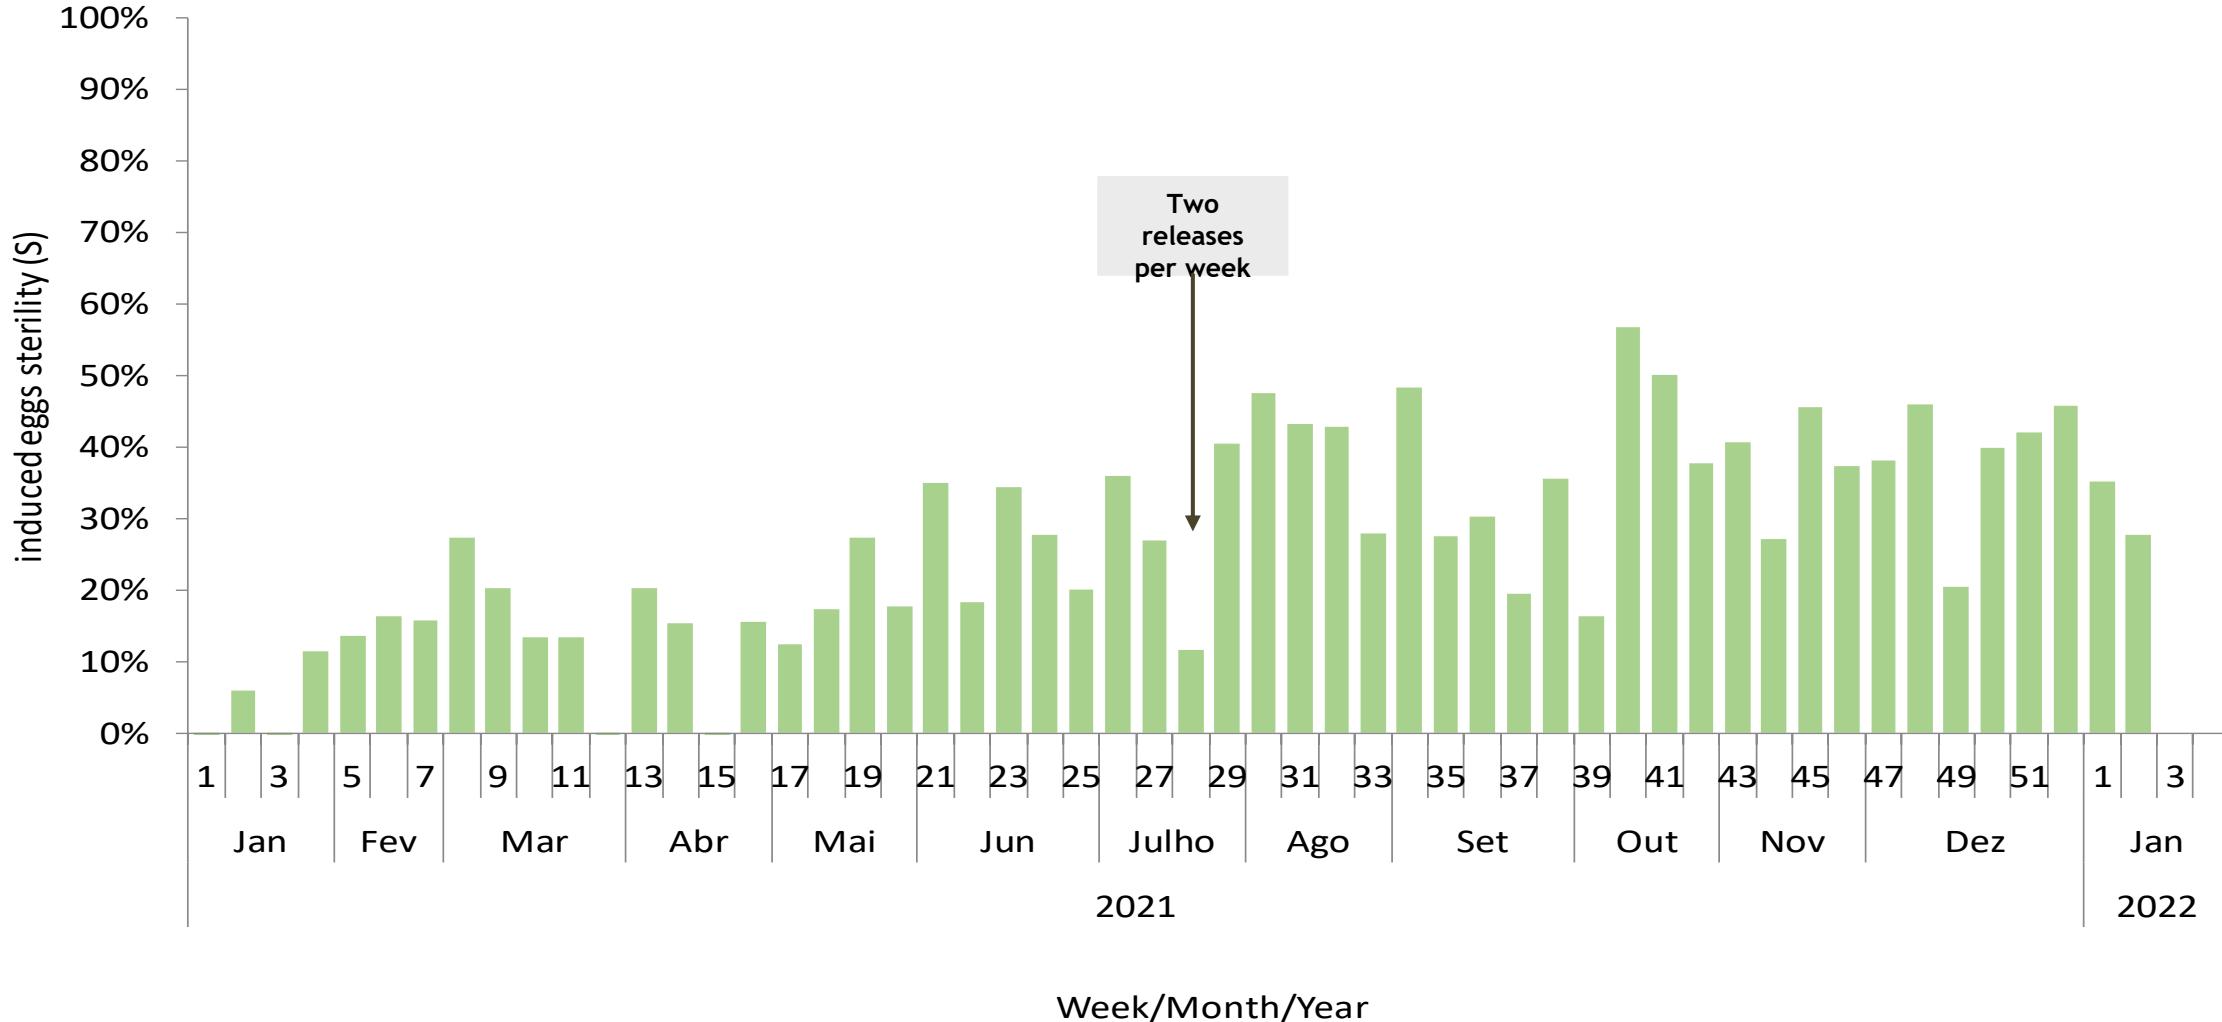

✓ Eggs Hatching - Pina and B. Teimosa

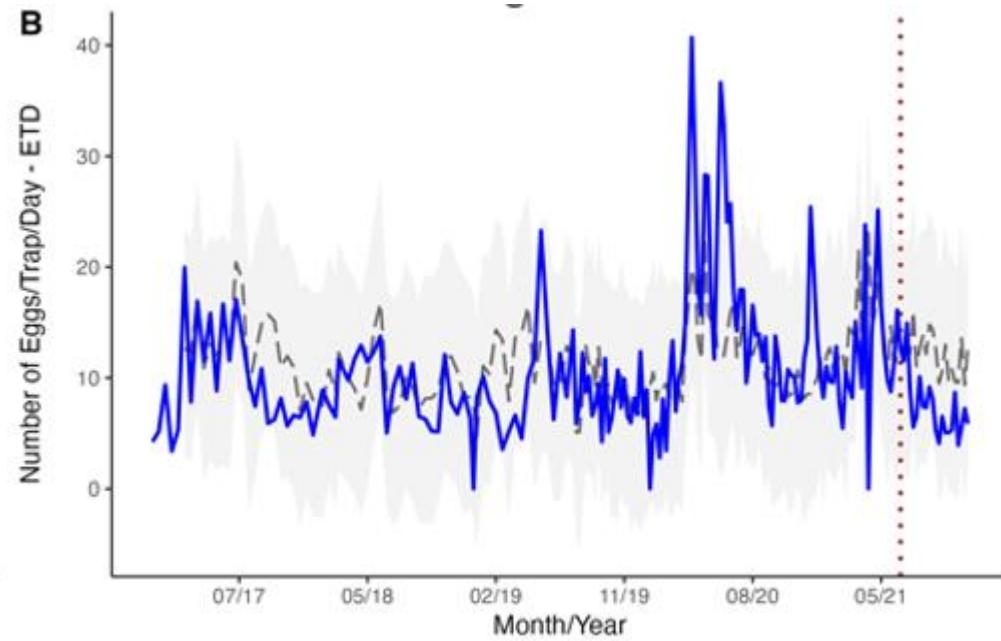

✓ % of decreased egg density during releases

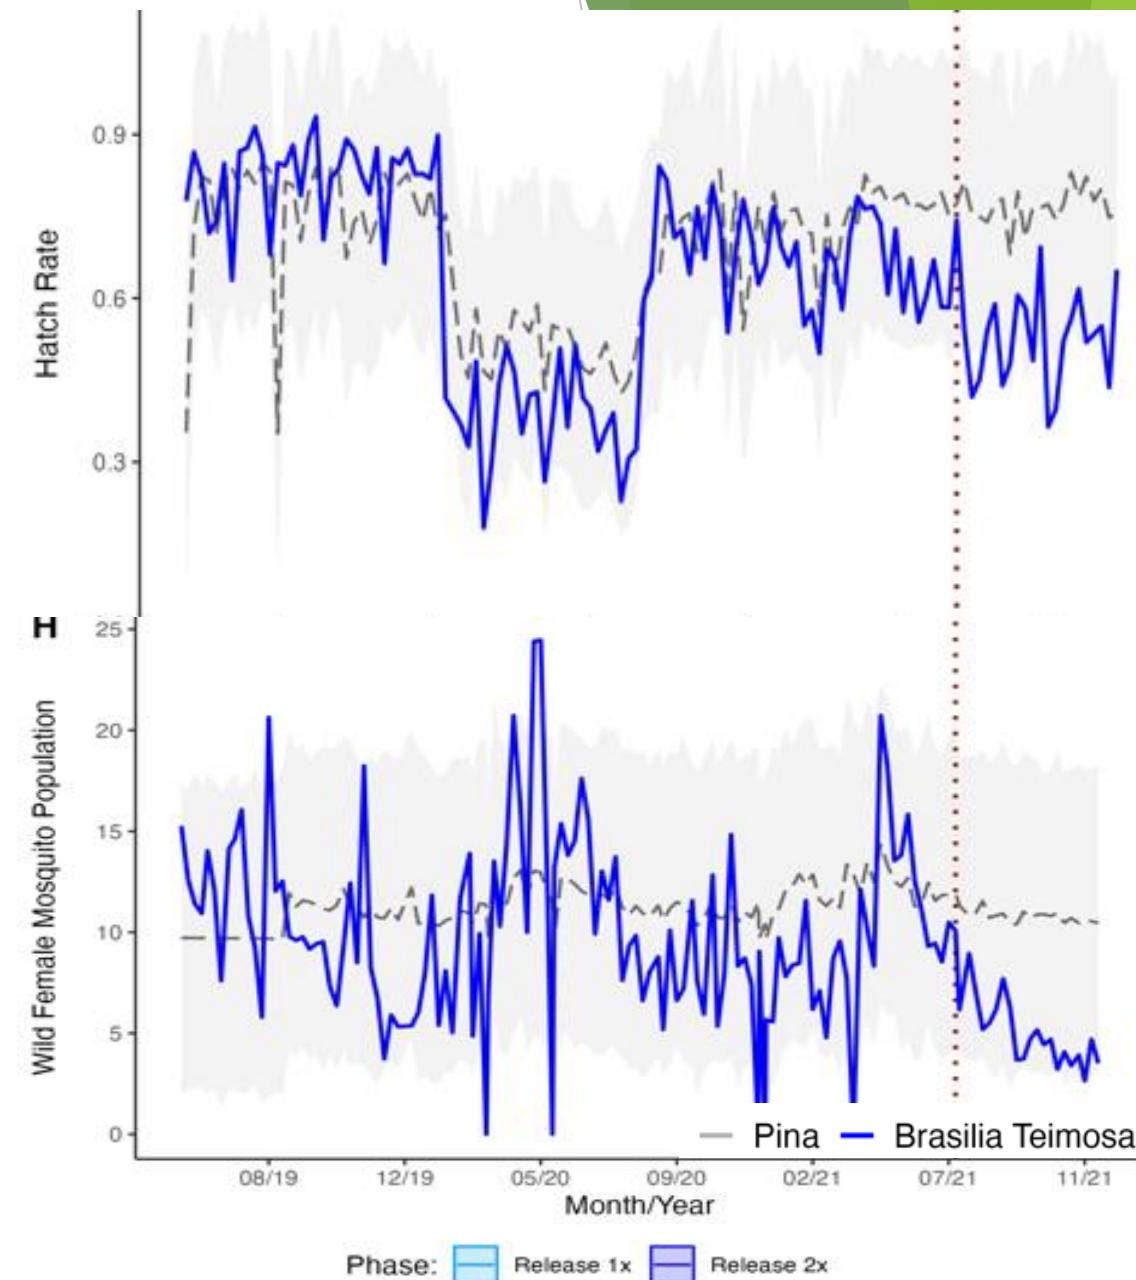

✓ Induced eggs sterility

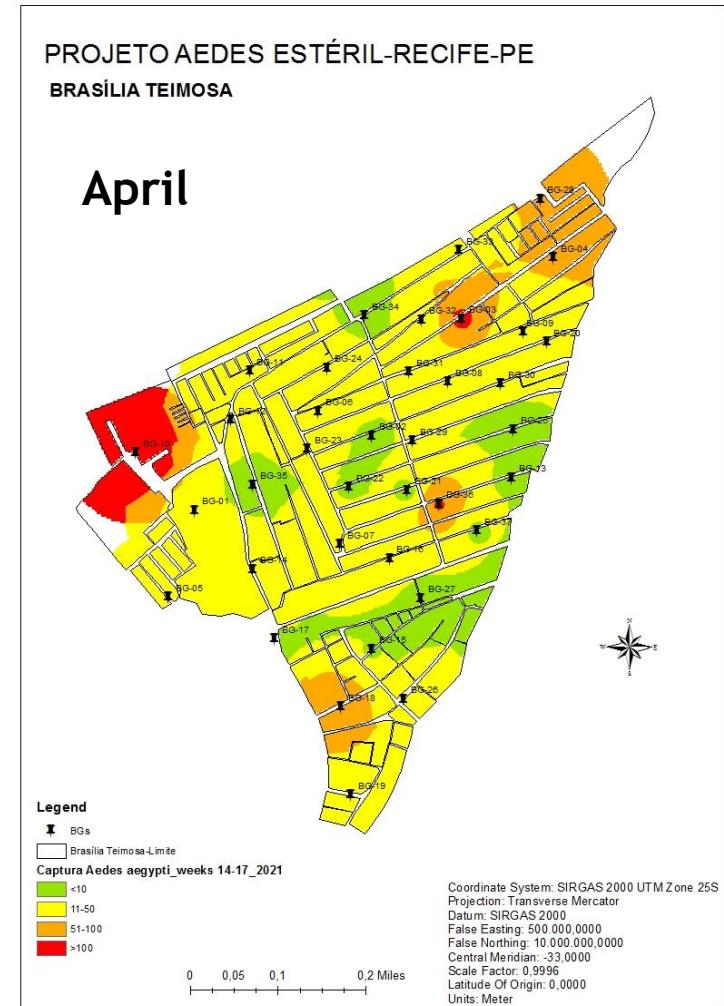

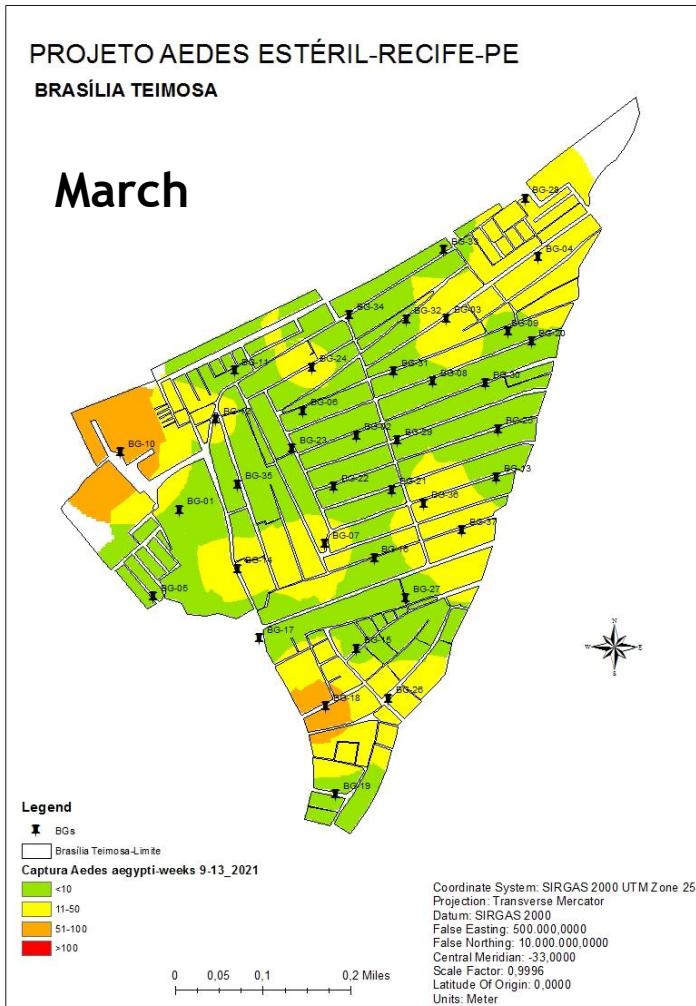

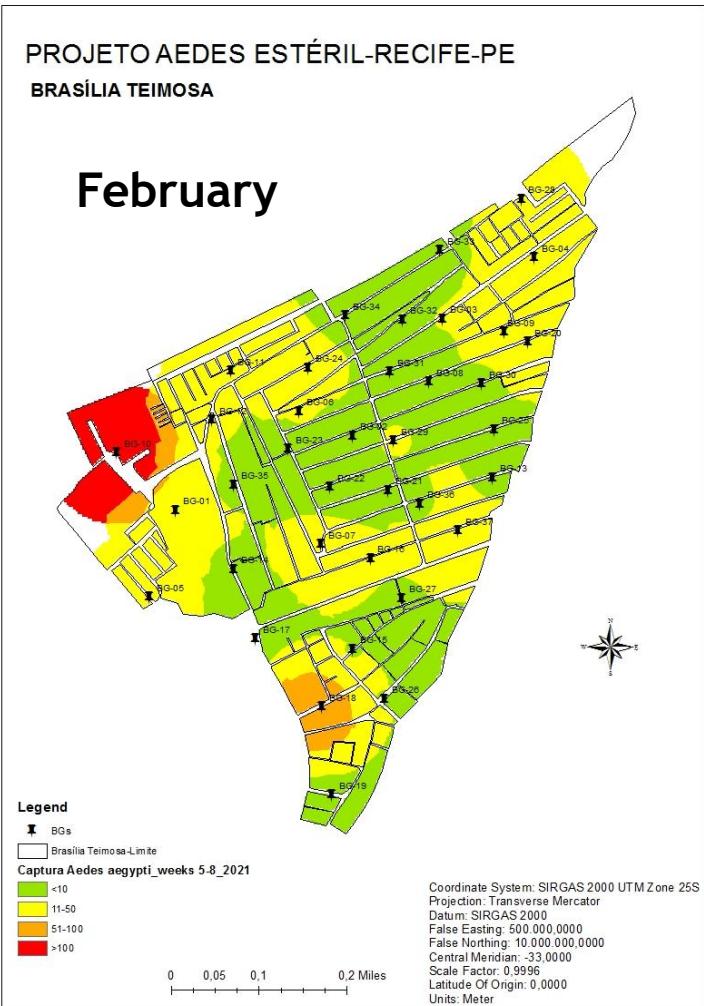

Results..

- Decrease of 39% ETD
- 33% reduction in hatch rate,
- induced sterility from around 30 %

Community Engagement Activities

Community Engagement Activities: Pre-releases.

Institutional Support

Rafael Grossi, DG IAEA, visit the PAE in Recife, jul/21.

**Recognized as Collaborating Centre
of the International Atomic Energy Agency**

Some insights

- Surveillance is crucial and keep open mind to the results
- Create an institutional advisory group, with experts from entomology and epidemiology fields
- Assure quality of reared mosquitoes
- Choose the release mechanism that is easier to use (it doesn't matter if the release is ground or aerial)
- To promote the integration of the SIT with others control methods of the *A. aegypti* vector.

Lessons Learned

Adult irradiation

Release twice a week

Community engagement and involvement

Additional suppression tools

Challenges on irradiation, handling and transport of sterile males

Next steps

- Move from the pre-operational phase to the operational phase
- Expand and **automate** the facilities for producing sterile mosquitoes for irradiation
- IVM with focus in the SIT.
- Support other Member States in implementing their SIT Projects

Institutions involved

- ✓ **IAEA** - technical and financial support.
- ✓ **Government of the State of Bahia:** Institutional support and final user of the evaluated technology.
- ✓ **Ministry of Health:** financial agent; end-user of the evaluated technology
- ✓ **Ministry of Agriculture :** end-user of the evaluated technology
- ✓ **Ministry of Science, Technology and Innovation** - financial support. CNPq and FINEP.
- ✓ **Department of Nuclear Energy/Federal University of Pernambuco State**
Insect irradiation, supporting the dose definition tests, dose map and dosimetry.
- ✓ **PAHO** - technical support.
- ✓ **CNEN** - NLO and technical support.

Obrigado!
