

# POSTGRADUATION PROGRAM IN REMOTE SENSING (PG-SER)

---

---

## Academic Coordinator

Ieda Del'Arco Sanches

## Course Council Members

Ieda Del'Arco Sanches (President)  
Evlyn Márcia Leão de Moraes Novo  
Lênio Soares Galvão  
Camilo Daleles Rennó  
Caio Arlanche Petri (Student Representative)  
Daniel Andrade Maciel (alternate Student Representative)

## Faculty Members

Antônio Miguel V. Monteiro, Ph.D., Univ. Sussex, 1993  
Camilo Daleles Rennó, Doctor, INPE, 2003  
Cláudia Maria de Almeida, Doctor, INPE, 2003  
Cláudio Clemente Faria Barbosa, Doctor, INPE, 2005  
Diógenes Salas Alves, Doctor, Univ. de Paris, 1983  
Douglas Fco. Marcolino Gherardi, Ph.D., Royal Hol. Univ. London, 1996  
Elisabete Caria Moraes, Doctor, INPE, 2002  
Evlyn Márcia Leão de Moraes Novo, Doctor, USP, 1984  
Fábio Furlan Gama, Doctor, INPE, 2007  
Hermann Johan Heinrich Kux, Ph.D., Univ. Freiburg, 1976  
Ieda Del'Arco Sanches, Ph.D., Massey Univ., Nova Zelândia, 2009  
João Antonio Lorenzetti, Ph.D., Univ. of Miami, USA, 1985  
José Claudio Mura, Doctor, INPE, 2000  
Leila Maria Garcia Fonseca, Doctor, INPE, 1999  
Lênio Soares Galvão, Doctor, USP, 1994  
Liana Oighenstein Anderson, Doctor, Univ. Oxford, Inglaterra, 2011  
Luciano Ponzi Pezzi, Ph.D., Univ. of Southampton, 2003  
Luciano Vieira Dutra, Doctor, INPE, 1989  
Luiz Eduardo Oliveira e Cruz de Aragão, INPE, 2004  
Márcio de Morisson Valeriano, Doctor, UNESP, 1999  
Maria Isabel Sobral Escada, Doctor, INPE, 2003  
Milton Kampel, Doctor, USP, 2003  
Sidnei João Siqueira Sant'Anna, Doctor, ITA, 2009  
Silvana Amaral Kampel, Doctor, USP, 2003  
Thales Sehn Körting, Doctor, INPE, 2012  
Waldir Renato Paradella, Doctor, USP, 1983  
Yosio Edemir Shimabukuro, Ph.D., Colorado State Univ., 1987

# REMOTE SENSING PROGRAM (PG-SER)

---

## FIRST PERIOD

---

### MANDATORY COURSES (for Master degree)

---

SER 205-3	Introduction to Remote Sensing
SER-333-3	Physical Principles of Remote Sensing

---

### ELECTIVE COURSES

---

SER-300-4	Fundamentals of Geoprocessing
SER-347-3	Introduction to Programming for Remote Sensing
SER-730-0	Master research in remote sensing
SER-780-0	Doctoral research in remote sensing

---

## SECOND PERIOD

---

### MANDATORY COURSES (for Master degree)

---

SER-413-4	Digital Image processing in remote sensing
-----------	--

---

### ELECTIVE COURSES

---

SER-204-3	Statistics Applied to Remote Sensing
SER-311-3	Remote Sensing of Climate
SER-332-2	Radar Imaging: Principles and Applications
SER-335-3	Spectral reflectance of natural targets
SER-406-3	Agricultural Remote Sensing
SER-415-3	Detection and Analysis of Land Use and Land Cover Change Patterns
SER-457-3	Population, Space and Environment
SER-730-0	Master research in remote sensing
SER-780-0	Doctoral research in remote sensing

---

## THIRD PERIOD

---

### MANDATORY COURSES (for Master degree)

---

SER-348-3	Methodologies for study of the physical environment
-----------	---

---

### ELECTIVE COURSES

---

SER-301-3	Spatial Data Analysis
SER-319-3	Hyperspectral Remote Sensing
SER-338-3	Spatial Dynamic Modeling
SER-339-3	Pattern Recognition and Computational Learning Methods for Remote Sensing
SER-340-3	Remote Sensing of the Oceans
SER-341-3	Remote Sensing and Spectral Data Analysis Techniques in Aquatic Ecosystems
SER-410-3	SAR image processing
SER-411-3	Advanced Topics in Digital Image Processing
SER-455-3	Special Topics in Forestry: Phytogeography and Remote Sensing Applications
SER-730-0	Master research in remote sensing
SER-780-0	Doctoral research in remote sensing

---

## EMENTA DAS DISCIPLINAS

### 1º PERÍODO LETIVO

#### 1. **SER-205-3 – Introduction to Remote Sensing**

**Workload:** 45 class hours

**Total number of credits:** 3 (three)

**Mandatory course:** for the Master Degree

**Prerequisite:** none

**Lecturers:** Dr Milton Kampel (PG-SER Faculty) - **Responsible**

Dr Claudia Maria de Almeida (PG-SER Faculty)

Dr. Luiz Eduardo O. e Cruz de Aragão (PG-SER Faculty)

Dr Leila Maria Garcia Fonseca (PG-SER Faculty)

Dr Hermann Johann Heinrich Kux (PG-SER Faculty)

Dr Fabio Furlan Gama (PG-SER Faculty)

#### **PROGRAM:**

Remote sensing history as an Earth Observation data acquisition system. Space programs, segments, phases, requirements, limitations, mission types, and payloads. Types of Earth Observation satellite orbits. Data acquisition levels, resolutions, sampling scales. Data and information flow, calibrations, corrections, calculation of geophysical parameters, composites, analyzes. Types and classes of remote sensors. Optical sensors in the Visible. Thermal infrared sensors. Synthetic Aperture Radar. Other remote sensors. High spatial resolution sensors. Aerophotogrammetry. Drones. Remote sensing products. Applications in vegetation, urban areas, agriculture, ocean and inland waters. Future perspectives.

## 2. SER-333-3 - Physical Principles of Remote Sensing

**Workload:** 45 class hours

**Total number of credits:** 3 (three)

**Mandatory course:** for the Master Degree

**Prerequisite:** none

**Responsible Lecturer:** Dr Elisabete Caria Moraes (PG-SER Faculty)

**OBJECTIVE:** To provide the student with basic knowledge about electromagnetic radiation, radiation attenuations and the interaction of solar radiation with targets on the earth's surface. In addition, the course shows the student through radiometry how to measure and evaluate the radiations that is reflected and emitted by targets. Finally, to present and discuss radiation laws, atmospheric radiative transfer and the Earth-Atmosphere energy balance.

### **PROGRAM:**

Radiation fundamentals for atmospheric applications and characterization of the Earth's surface: A nature of radiant energy. Radiant energy. Electromagnetic spectrum. Radiometric quantities. Electromagnetic radiation sources (REM). Interaction of electromagnetic radiation with terrestrial targets. Radiometry: instrumentation, reflectance factor, laboratory and field radiometric practices. Electromagnetic energy emissions: Plank, Stefan-Boltzmann and Wien laws. Introduction to radiative transfer. Atmospheric composition. Atmospheric attenuation. Selective absorption and emission by atmospheric gases. Radiation transfer equation. Lambert-Bouguet-Beer Law: formulation of flux absorption. Field practice. Schwarzschild's equation and its solution. Infrared radiative transfer equation: absorption and emission. Radiation transfer equation in parallel plane atmosphere. Radiative equilibrium model. Radiation balance in the Earth-Atmosphere system: Solar radiation incident on top of the atmosphere. Solar constant. Solar irradiance distribution on the earth's surface. Radiative emission of planets from the solar system. Balance of global radiative energy flow.

### 3. SER-300-4 – Fundamentals of Geoprocessing

**Workload:** 60 class hours

**Total number of credits:** 4 (Quatro)

**Elective course**

**Prerequisite:** none

**Lecturers:** Dr. Antonio Miguel Vieira Monteiro (PG-SER Faculty) - **Responsible**

Dr. Claudio Clemente Faria Barbosa (PG-SER Faculty) - **Responsible**

Dr Maria Isabel Sobral Escada (PG-SER Faculty)

Dr Silvana Amaral Kampel (PG-SER Faculty)

Dr. Eymar Lopes (DPI)

Dr. João Pedro Cordeiro (DPI)

Dr. Júlio César Lima D'Álge (DPI)

Dr Karine Reis Ferreira (DPI)

Dr. Gilberto Ribeiro (DPI)

#### **OBJETIVES:**

The SER-300 course aims to offer an overview of the Geoprocessing area, when discussing the theoretical foundations of GeoInformation Science and Engineering, and its application areas that include environmental, urban, socio-economic, population, protective capacity, public policies, public health, among others. At the end of the course, the student should be able to develop a medium-sized geoprocessing project in an application domain, that includes from the conceptual modeling of the system, the production of results in a sgeographic information system and analysis of the results, generating an end-of-course monograph.

#### **PROGRAM:**

Computational Representations of the Geographic Space:

The problem of computational representation of space.

Concepts: Space, Scale, Model, Spatial Dependence

Types of Geographic Data.

Data Structures in GIS.

GIS architectures.

Data Modeling in Geoprocessing.

Spatial Data Integration:

Cartography for Geographic Information Systems.

Geographic Data Interoperability.

Open Standards; Specifications - OGC

Open Software in GIS

Remote Sensing and GIS: What does an image contain?

Geographic Data Operations:

Numerical Terrain Modeling.

Introduction to Geostatistics.

Map Algebra.

Geographic Inference and Decision Support.

Application Examples:

Ecological-Economic Zoning.

Geological Prospecting.

Public health.

Municipal Management.

Population Studies.

## 4. SER-347-3 – Introduction to Programming for Remote Sensing

**Workload:** 45 class hours

**Total number of credits:** 3 (three)

**Elective course**

**Prerequisite:** none

**Lecturers:** Dr. Thales Sehn Körting (PG-SER Faculty) - **Responsible**

Dr. Gilberto Ribeiro de Queiróz (PG-CAP)

Dr. Fabiano Morelli

## OBJETIVES:

The huge amount and diversity of data sources from Remote Sensing has changed the way research is performed in this area. New requisites for scientists, including tools for data processing, goes beyond using only graphical interfaces. Several GIS (Geographical Information Systems) contains tools integrating programming languages with graphical interfaces. This course presents basic techniques and tools to aid the research in Remote Sensing, including data acquisition, organization and integration, analysis and visualization. The students will learn an overview on how to build small computer programs using Python programming language, for automating repetitive tasks, to extract, transform and analyse geospatial data.

## PROGRAM:

Introduction to Logic Programming: The Python programming language. Data Types. Variables and attribution. Reading data. Control structures, sequences, functions. Manipulating and analysing matricial data: Layer stack. Spatial reference systems. Raster crop and mosaicking. Basic statistics from images. Band math. Visualization. Manipulating and analysing vectorial data: Spatial operations (meter, buffer, sets, topological). Manipulating shapefiles (KML, GeoJSON, ESRI shapefiles). Spatial reference systems. Integrating matricial and vectorial data: raster and geometries. Time series: obtaining time series using web services. Visualization and analysis of time series.

## EMENTA DAS DISCIPLINAS

### 2º PERÍODO LETIVO

#### 1. SER-413-4 - Digital Image processing in remote sensing

**Workload:** 45 class hours

**Total number of credits:** 4 (four)

**Mandatory course:** for the Master Degree

**Responsible Lecturers:** Dr. Leila Maria Garcia Fonseca (PG-SER Faculty)  
Dr. Thales Sehn Korting (PG-SER Faculty)

#### PROGRAM:

**Introduction:** Objective, Examples off Remote Sensing Applications, Image Processing Steps, Imagery Systems; **Mathematical Fundamentals:** Fourier Transform, Wavelet Transform (WT), Spatial Statistics, Image Normalization; **Radiometric and Geometric Corrections:** Atmospheric Correction, Radiometric Calibration, Noise Reduction, Image Registration, Geometric Transformation, Interpolation, restoration; **Spatial Transforms:** Convolution Filters; **Spectral Transforms:** Ratio, Contrast Enhancement, Principal Components (PC), Linear Mixing Model; **Color Systems:** RGB, IHS; **Color Enhancement:** color-space transform, Pseudocolor, False Color, Decorrelation; **Multi-Image Fusion:** PC, IHS, WT. **Segmentation:** Edge Detection, Region Growing, Graph-Based Segmentation, Parallel Segmentation, Classification-Based Segmentation, Multitemporal Segmentation. **Classification:** Maximum Likelihood, Euclidean Distance, Neural Networks, Self-Organizing Maps, Bhattacharrya, Isodata, K-Means, Region-Based Classification, Decision Trees, Feature Selection, Object-Based Classification.

## **2. SER-204-3 – Statistics Applied to Remote Sensing**

**Workload:** 45 horas/aulas

**Total number of credits:** 3 (three)

**Elective course**

**Prerequisite:** none

**Responsible Lecturer:** Dr. Camilo Daleles Rennó (PG-SER Faculty)

### **GOAL:**

Some fundamental concepts will be discussed to improve knowledge about statistical procedures commonly used in Remote Sensing and related areas. Many examples and exercises presented during the course are related to Remote Sensing and Geoprocessing. It is highly recommended that the student already have basic knowledge of probability and descriptive statistics.

### **PROGRAM:**

Basic statistical review: random variables, discrete and continuous distributions, and central limit theorem. Statistical inference: concepts; biased estimates; accuracy and precision, sample distributions. Confidence interval and hypothesis testing. Analysis of variance. Regression analysis. Principal components. Cluster analysis. Sampling theory. Resampling techniques. Classification evaluation: confusion matrix, total accuracy, agreement and error indices. Nonparametric statistics. Uncertainty assessment. Stochastic simulation and credibility interval.

### 3. SER-311-3 – Remote Sensing of Climate

**Workload:** 45 class hours

**Total number of credits:** 3 (three)

**Elective course**

**Prerequisite:** none

**Responsible Lecturer:** Dr. Milton Kampel (PG-SER Faculty)

#### **PROGRAM:**

Solar radiation: physical characteristics, governing equations. Energy and radiation budget in the Earth / Atmosphere system and its climatic implications. The role of atmospheric constituents in absorption bands. Remote sensing of longwave radiation and precipitation. Satellite products time series for climate studies: vegetation indices, queimadas, sea surface temperature, ocean color, precipitation, surface wind. Time series analysis techniques for studies on spatial and temporal variability and climate connections. Applications of remote sensing and climate modeling in health.

### 4. SER-332-2 - Radar Imaging: Principles and Applications

**Workload:** 30 class hours

**Total number of credits:** 2 (Dois)

**Elective course**

**Prerequisite:** none

**Lecturers:** Dr. Fábio Furlan Gama (PG-SER Faculty) - **Responsible**  
Dr. Waldir Renato Paradella (PG-SER Faculty)

#### **PROGRAM:**

History of radar use. Radar imaging, advantages and disadvantages. Electromagnetic waves, phase, polarization, wavelength concepts. The electromagnetic and microwave spectrum. Real (RAR) and Synthetic (SAR) Aperture Radar. The radar equation. Imaging geometry. Angular quantities (depression, incidence, local incidence, azimuth). Range and Azimuth. Topographic distortions (foreshortening, layover, shadowing). Spatial resolution. Resolution cell. Digital sampling. Spatial resolution in range and azimuth. Macro topography (shape and orientation of targets / antenna). Surface roughness and surface and volumetric scattering mechanisms. Corner reflectors. Dielectric Constant. Speckle noise. Conventional, polarized and polarimetric radar. Orbital SAR systems. Polarimetry. Representation of polarimetric signatures. Interferometry, and differential interferometry. Use of SAR image processing softwares. The ALOS / PALSAR and Sentinel-1 polarimetric systems. Potential in Cartography, Geology, Forests, Agriculture, Hydrology and Urbanism Applications.

**5. SER-335-3 - Comportamento Espectral de Alvos**

**Workload:** 45 class hours

**Total number of credits:** 3 (three)

**Elective course**

**Prerequisite:** SER-333-3 Princípios Físicos de Sensoriamento Remoto

**Lecturers Responsáveis:**

Dr Evlyn Márcia Leão de Moraes Novo (PG-SER Faculty)

Dr Elisabete Caria Moraes (PG-SER Faculty)

Dr. Lênio Soares Galvão (PG-SER Faculty)

Dr. Cláudio Clemente Faria Barbosa (PG-SER Faculty)

Dr. Yosio Edemir Shimabukuro (PG-SER Faculty)

**PROGRAM:**

Interaction between the electromagnetic radiation (EMR) and Earth surface targets. Radiometric concepts and methods. Plant leaf spectral reflectance. Canopy spectral Reflectance. Canopy Reflectance Models. Spectral reflectance of pure water. Spectral reflectance of water bodies. Spectral reflectance of mineral and rocks. Soil spectral reflectance. Methods for spectral data analyses. Lectures. Laboratory and field experiments. Seminars.

## **6. SER- 406-3 – Agricultural Remote Sensing**

**Workload:** 45 class hours

**Total number of credits:** 3 (three)

**Elective course**

**Prerequisite:** none

**Responsible Lecturer:** Dr Ieda Del´Arco Sanches (PG-SER Faculty)

### **PROGRAM:**

Introduction to Agricultural Remote Sensing. Spectral behavior of agricultural targets (vegetation, straw and soil). Spectral vegetation indices. Visual interpretation of agricultural targets in orbital optical images. The impact of cloud cover on satellite imagery for monitoring agricultural activity. Dynamics of Brazilian agriculture and agricultural targets. Time series analysis. Agricultural statistics in Brazil. Monitoring and mapping of agricultural crops. Productivity of agricultural crops. Precision agriculture.

## 7. **SER - 415-3 - Detection and Analysis of Land Use and Land Cover Change Patterns**

**Workload:** 45 class hours

**Total number of credits:** 3 (three)

**Elective course**

**Prerequisite:** none

**Lecturers:** Dr Maria Isabel Sobral Escada (PG-SER Faculty) - **Responsible**

Dr. Thales Sehn Korting (PG-SER Faculty)

Dr. Sidnei João Siqueira Sant'Anna (PG-SER Faculty)

Dr. Sérgio Rosim (DPI)

MSc. Mariane Souza Reis

MSc. Luis Eduardo Pinehiro Maurano (DPI)

MSc. Lidiane Cristina Oliveira Costa (Bolsista)

Concerning about land use change and land cover has emerged in global research agendas a few decades ago, mainly due to its influence on climate change at local and global scales. Human activities are largely responsible for changes in land use and land cover which often result in a mosaic of fragmented landscapes and a mixture of natural and anthropogenic patches, which vary in size, shape and spatial arrangement. Understanding human intervention on the landscape and the direct and indirect consequences of it in land use and land cover spatial patterns and in ecological processes, is fundamental for land management and planning issues and land use modeling. Remote sensing multitemporal data, coupled with the use of pattern recognition techniques, landscape ecology concepts and metrics and data mining techniques represent important tools for the study of land use and land cover spatial-temporal patterns. The aim of this course is to enable students to understand and discuss concepts and methodologies for studying patterns of land use and land cover change, not only as a result of human land surface processes, but also as a component of terrestrial systems, which modify and are modified by abiotic and biotic factors.

### **Topics covered**

1. Patterns and processes of land use and land cover change: Conceptual and theoretical framework.
2. Land use and land cover classification systems.
3. Landscape Ecology: Concepts, methodological approaches and factors that influence landscape spatial patterns and change.
4. Use of landscape metrics to detect land use and land cover change (LUCC) patterns.
5. Change detection techniques in LUCC applications
6. Utilization of spatial tools and remote sensing data for detecting land use and land cover change patterns.
7. Use of pattern recognition and data mining techniques to link LUCC patterns to socioeconomic and ecological processes
8. Landscape stratification for computational modelling of patterns and processes in LUCC.

## **8. SER-457-3 Population, Space and Environment**

**Workload:** 45 class hours

**Total number of credits:** 3 (three)

**Elective course**

**Prerequisite:** none

**Responsible Lecturers:** Dr Silvana Amaral Kampel (PG-SER Faculty)

Dr Antônio Miguel V. Monteiro (PG-SER Faculty)

### **RESUME:**

The impacts of human activities on terrestrial systems imply significant modifications on the hydrological, ecological, geomorphologic, climatic and biogeochemical cycles. Working with environmental and socioeconomic databases, with geographical representation, is a necessary skill to the populational studies involving interactions between social and natural environments. In this context, remote sensing (RS) data, geoinformatics and spatial analysis techniques are valuable tools to integrate different data sources, enabling populational studies integrating the population and the territory where they live.

Landscape patterns and environmental profiles extracted from RS data can provide information to assist studies in migration, family arrangements, spatial distribution of the population and small area population estimates. Estimates of population counting and projections are also good opportunities for the integrated use of RS and geoinformatics techniques. Economic indicators, such as those reflecting quality of life, development indices and sustainability indices, etc., can be inferred or built from integration of remote sensing, economic databeas and demographic and agricultural census data..

### **OBJECTIVE:**

Grounding students in theories, methodologies and technologies of geoinformatics, remote sensing, and spatial analysis appropriate for the manipulation, intergration and processing of demographic, economic and environmental databases.

### **PROGRAM:**

Socioeconomic and demographic data: origin, indicators and spatial indexing. Spatial analysis applied to studies of socioeconomic and demographic processes. Spatial data integration: socioeconomic, demographic and remote sensing data. The Scale Effect: Inventory Scale and Integration Scale. Data aggregation / disaggregation and data structure in Geographical Information System. How to build Socio-spatial indicators. Methods of data integration: from field data research to density probability surfaces.

Examples of applications in health, safety, urbanism, land use and land cover, demography, and others. Socioeconomic and demographic variables for scenario analysis in global climate change studies.

## EMENTA DAS DISCIPLINAS

### 3º PERÍODO LETIVO

#### 1. **SER-348-3 - Methodologies for study of the physical environment**

**Workload:** 45 horas

**Total number of credits:** 3 (three)

**Mandatory course:** for the Master Degree

**Responsible Lecturer:** Dr Márcio de Morisson Valeriano (PG-SER Faculty)

#### **Objective:**

The course aims at planning skills for the development of environmental information, from the selection of data sources, analysis resources and methods for data processing up to the confection of related pre- and post-execution documents.

Contents:

**1 - Introduction** – remote sensing in the geosciences context: information as the main subject of geotechnologies; typical dynamics of requests; job types: survey, prospection, environmental diagnosis and planning, basic and applied research. Cartographic production and its goals; systematic and thematic cartography; temporal, spatial and thematic scales; legend specifications; generalizing and detail.

**2 – Concepts** – geographic data: position, attributes and dynamics; typical structures of geographic data; applications, sources and typical uses of remotely sensed imagery for landscape systems; natural structures of landscape elements; data acquisition and storing structures. The complex systems concept applied to the genesis and development of information; specific conceptual inputs from remote sensing: basic and applied research along the development of geographical information.

**3 - Techniques** – decomposing demands into elementary processes; survey steps and processes for developing the geographical information. Geoprocessing resources for geographic data: functional description of a GIS; basic functions: structure, analysis and query. Data integration techniques. Changes on data structure. Errors: types and sources; recommendations and control procedures; precision and accuracy measurements; scale x resolution; evaluation and qualification of remote sensing products. Communication levels in remote sensing activity and applications: image, map, map documentation, bulletin, preliminary and execution projects, technical report, oral communications, article, lesson, dissertation and thesis. Exercises.

## 2. SER-301-3 – Spatial Data Analysis

**Workload:** 45 class hours

**Total number of credits:** 3 (three)

**Elective course**

**Prerequisite:** SER-300-4

**Lecturers:** Dr. Antonio Miguel Vieira Monteiro (PG-SER Faculty) - **Responsible**

Dr. Eduardo Celso Gerbi Camargo (DPI)

Dra Silvana do Amaral Kampel (PG-SER Faculty)

Dr. Carlos Felgueiras (DPI)

Dr Jussara Ortiz (DPI)

Dr. Pedro Andrade (CCST)

### **OBJETIVES:**

The SER-301 course presents the main techniques of Spatial Data Analysis in the context of studies of space-time phenomena, including Spatial Statistics, Geostatistics, Spatial Regression, and spatially explicit Dynamic Modeling. The purpose of using Spatial Data Analysis techniques is to seek revealing and describing existing patterns in geographic data and establish, preferably quantitatively, but not exclusively, the relationships between the different geographic variables and the phenomena under study. At the end of the course, the student should be able to establish procedures that allow to describe, in a quantitative way, the importance and contribution of each of the data used in their studies and design an experiment to test the hypothesis raised.

### **PROBRAM:**

The problem of spatial analysis. Components of spatial analysis: exploration, consultation, manipulation and modeling. Types of spatial analysis. References. Analysis of point data: "Kernel estimation", K-function. CSR tests. Surface Analysis by Geo-Statistics: exploratory analysis, Variography, Krigeagem and its various forms; case studies. Analysis of Areal Data: proximity matrix, spatial correlation, Bayesian methods. Autocorrelation indicators (global and local). Empirical Estimation of Bayes. Spatial Regression: Ordinary regression models, autoregressive, spatial regimes. Case studies. Representation of Uncertainty: Geostatistics and Uncertainty Measures. Krigeagem by indication as estimator of the probability distribution of random variable. Uncertainty of numerical and thematic fields. Stochastic Simulation.

## 3. SER-319-3 - Hyperspectral Remote Sensing

**Workload:** 45 class hours

**Total number of credits:** 3 (three)

**Elective course**

**Prerequisite:** none

**Lecturers:** Dr. Lênio Soares Galvão (PG-SER Faculty) - **Responsible**

Dr Ieda Del'Arco Sanches (PG-SER Faculty)

### **PROGRAM:**

Introduction and principles; multispectral and hyperspectral remote sensing; images and spectra; hyperspectral cube; airborne and orbital hyperspectral instruments; future

satellite missions; factors affecting hyperspectral data acquisition; spectral reflectance of targets (e.g., water, vegetation, rocks, soils, urban materials); hyperspectral image pre-processing; atmospheric effects; atmospheric correction of hyperspectral data; empirical, semi-empirical and physical-based methods; hyperspectral vegetation indices; band-depth calculation in images; hyperspectral image processing; target detection in hyperspectral scenes (SAM and SFF techniques); linear spectral mixture models; endmember selection: simple and elaborated methods; fraction-images; state-of-the-art of the hyperspectral studies and applications.

#### **4. SER-338-3 - Spatial Dynamic Modeling**

**Workload:** 45 class hours

**Total number of credits:** 3 (three)

**Elective course**

**Prerequisite:** None

**Responsible Lecturer:** Dr Claudia Maria de Almeida (PG-SER Faculty)

#### **PROGRAM:**

Theoretical issues: Historical perspective of land use and land cover dynamic models. Cellular Automata. Spatial dynamic models: Concepts, typologies, refinements, state-of-the-art. Deterministic models: BASS II, SLEUTH, SACI and others. Agent-based models: REPAST, MICE, StarLogo and others. Stochastic models: Dinamica EGO, Simlucia, Clue-S, TerraME and alike. 3-D models: PC Raster. Methodological issues in stochastic models. Statistical techniques for parameterization: Rule sets, weights of evidence, logistic regression, artificial neural networks. Calibration methods: Heuristic techniques, line generalization algorithms, fractal parameters. Validation approaches: Goodness-of-fit indices, multiple resolution methods, conventional and adapted fuzzy similarity index. Principal components in step-based modeling: Annual derivation of the global transition probabilities matrix. Statistical methods for forecasts: Stationary (Markov chain) and non-stationary (linear regression and extrapolation, time series).

### **5. SER-339-3 - Pattern Recognition and Computational Learning Methods for Remote Sensing**

**Workload:** 45 class hours

**Total number of credits:** 3 (three)

**Elective course**

**Prerequisite:** none

**Lecturer:** Dr. Luciano Vieira Dutra (PG-SER Faculty) - **Responsible**  
Dr Marinalva Dias Soares (Collaborator)

#### **PROGRAM:**

Introduction to Pattern Recognition; Typical sequence of a computer learning system for remote sensing image analysis; Classifier types and characteristics: statistical, deterministic, hierarchical; Objects for classification: pixel and regions; Maximum likelihood and Iterative Conditional Modes (contextual); SVM- vector support machines; Decision Tree Classifiers; Methods of extraction and feature selection. Image segmentation, segment classification; Accuracy assessment.

## 6. SER-340-3 - Sensoriamento Remoto dos Oceanos

**Workload:** 45 class hours

**Total number of credits:** 3 (three)

**Elective course**

**Prerequisite:** SER- 333-3 - Physical Principles of Remote Sensing

**Lecturers:** Dr. Douglas Francisco Gherardi – **Responsible** (PG-SER Faculty)

Dr. João Antonio Lorenzzetti (PG-SER Faculty)

Dr. Luciano Ponzi Pezzi (PG-SER Faculty)

### PROGRAM:

1) Introduction to oceanography. Forces and movement in the ocean. Large scale and mesoscale ocean processes. 2) Calibration and validation of remote sensing data. 3) Interaction of the electromagnetic radiation with ocean water. Ocean color. 4) Estimating sea surface temperature with remote sensors, principles and applications. 5) Using microwaves to monitor the ocean. Scatterometer, Synthetic Aperture Radar (SAR) and altimetry. 6) Using remote sensing data for ocean modeling. 7) Remote sensing applications for tropical coastal management. Principles of biodiversity conservation and coastal management. 8) Applications of global ocean remote sensing data bases. 9) Hands-on research project.

## **7. SER-341-3 - Remote Sensing and Spectral Data Analysis Techniques in Aquatic Ecosystems**

**Workload:** 45 class hours

**Total number of credits:** 3 (three)

**Elective course**

**Prerequisite:** SER-333-3

**Responsible Lecturers:** Dr. Claudio Clemente Faria Barbosa (PG-SER Faculty)

Dr Evelyn M. Leão de Moraes Novo (PG-SER Faculty)

### **PROGRAM:**

Physical, chemical and biological properties of continental aquatic environments. Classification of continental aquatic systems: lotic, lentic and transition systems. Interactions between the Electromagnetic Radiation (EMR) and water bodies: Analyses of the aquatic system spectral behavior analysis and the spectral characterization of different types of water bodies. Inherent and apparent optical properties. Coefficients and functions of absorption, scattering and attenuation. Upward and downward irradiance and reflectance models above the water surface and within the water column. Spectral properties of optically active components (OAC). Empirical, semi-empirical and semi-analytical algorithms for OAC estimation. Factors controlling EMR / water bodies interactions. Water color simulators using analytical and semi-analytical algorithms: Hydrolight and WASI. Hyperspectral Data Analysis Techniques: Derivative Analysis, Band Ratio, Spectral Angle Mapping, Continuum Removal. Instrumentation: Operation and use of key equipment needed for monitoring and studying aquatic environments. Remote Sensing of Aquatic Environments: Concepts and modeling. Exemples of Applications.

### **Labs:**

In situ radiometric spectral measurements and water color simulations.

### **Student performance in the course:**

Project Proposal (20%), Monograph (40%), Review and presentation of a state of art article (40%).

## **8. SER-410-3 - SAR image processing**

**Workload:** 45 class hours

**Total number of credits:** 3 (three)

**Elective course**

**Pré-requisitos:** SER-332-2 Radar imageador: princípios e aplicações

**Lecturers:** Dr. José Claudio Mura (PG-SER Faculty) - **Responsible**

Dr. Sidnei João Siqueira Sant'Anna (PG-SER Faculty) - **Responsible**

**PROGRAM:**

SAR focusing. Radar image calibration. Speckle noise. Statistical modeling of SAR images. Speckle filtering. Classification and segmentation of SAR images. SAR image polarimetry. Statistical modeling of polarimetric data. Polarimetric calibration. Polarimetric classification. Interferometry and digital elevation construction. Differential SAR interferometry.

**9. SER-411-3 - Advanced Topics in Digital Image Processing**

**Workload:** 45 class hours

**Total number of credits:** 3 (three)

**Elective course**

**Prerequisite:** SER-413 Digital Image Processing in Remote Sensing

**Lecturers Responsables:** Dr Leila Maria Garcia Fonseca (PG-SER Faculty)

Dr. Thales Sehn Korting (PG-SER Faculty)

**PROGRAM:**

Advanced topics related to image processing applied to remote sensing: object based image analysis, time series processing, image segmentation, image classification, data mining, big data techniques, pattern recognition through decision tree methods, support vector machines, neural networks, deep learning, hybrid classification methods, classification accuracy assessment, optical filtering, image radiometric correction, image restoration, super resolution, feature extraction and selection, image fusion, generalized ratios.

## **10. SER-455-3 - Special Topics in Forestry: Phytogeography and Remote Sensing Applications**

**Workload:** 45 class hours

**Total number of credits:** 3 (three)

**Elective course**

**Prerequisite:** none

**Responsible Lecturers:** Dr Luiz Eduardo O. e Cruz de Aragão (PG-SER Faculty)  
Dr Liana Oighenstein Anderson (PG-SER Faculty)

### **PROGRAM:**

Definition and concepts. Earth's vegetation processes. Brazilian Phytogeography. Study of processes in phytogeographic domains: Amazon Forest, Atlantic Forest, Cerrado, Caatingaa Forest. Environmental and climatic impacts on vegetation. Contribution of remote sensing for detecting the impact of drought, burning and deforestation on forest functioning.

**EST – Guided Study in Remote Sensing**

**Up to 4 credits**

**SER-730 – Master Research in Remote Sensing\*\***

**0 credits**

**SER-750 - Master's Dissertation in Remote Sensing**

**12 credits**

**SER-780 – Doctoral Research in Remote Sensing\*\***

**0 credits**

**SER-800 – Doctoral Thesis in Remote Sensing**

**24 credits**

\*\* Mandatory activity, in each academic period for every student in the Research phase, defined by the formalization of their Research Supervisor that will evaluate the student's performance in this activity. Compulsory, also, before the officialization mentioned for the student who is not enrolled in any discipline; in this case, the orientation and evaluation should be made by a Faculty member approved by the Academic Coordinator.

Catalog approved by the CPG in November, XX, 2019
